

REFERENCE QUESTION OF ALL CHAPTER

1	Explain classes in JavaScript with syntax and example.
2	Explain how Proxy can be used for validation.
3	Explain different Proxy traps with example.
4	What are different ways of styling in React?
5	List any three advantages of React.
6	Differentiate between props and state.
7	Explain user-agent detection with limitations.
8	Explain the window object with its methods and properties.
9	Explain how to create, update, and delete elements in DOM.
10	Describe two collection reference types in JavaScript.
11	Describe a regular expression in JavaScript with an example.
12	Write differences between primitive and reference values in JavaScript.
13	Explain the concept of objects in JavaScript and how they function as the core component of OOP.
14	Discuss different ways of creating objects in JavaScript, and describe the working of prototype chain.
15	Describe the Proxies in JavaScript with their functionalities with an example.
16	Explain arrow functions in JavaScript, and how they differ from regular functions?
17	Explain the use of spread syntax in JavaScript functions with an example.
18	Explain asynchronous programming in JavaScript and the role of promises.
19	What are React component lifecycle methods?
20	Discuss how React manages the UI efficiently.
21	Describe state in React.
22	Explain different types of events in JavaScript with examples.
23	Explain the concept of event flow in JavaScript, including event capturing and event bubbling.
24	Describe the media events in JavaScript using media elements.
25	Explain the purpose and features of the window object in the Browser Object Model (BOM) with an example.
26	Describe the location object in the BOM and its uses for navigating or manipulating the URL.
27	Explain the concept of the DOM hierarchy. How does the node structure of the DOM work?
28	Discuss the difference between an array and an object in JavaScript.
29	Explain the concept of execution context in JavaScript and how it is related to scope.
30	Enlist keyword and data type used in JavaScript and give example of it.
31	Discuss the principles of encapsulation, inheritance, and polymorphism in OOP.
32	Describe the various ways to create objects in JavaScript, including object literals, constructors, and classes.
33	Write down code examples to illustrate the implementation of Proxy patterns in JavaScript.
34	Differentiate between function declaration and function expression with example.

35	Provide examples illustrating the usage of Promises and async functions in handling asynchronous tasks.
36	List and explain important function properties and methods, such as "length", "name", and "apply".
37	Explain the concept of components and their lifecycle in React.
38	Describe how you can access and manipulate DOM elements in a React application.
39	Differentiate between inline styles, CSS modules, and CSS-in-JS libraries.
40	Explain mouse events, keyboard events, and form events in web development.
41	Explain the event flow with capturing and bubbling phases in the context of web development.
42	Describe the event object and its properties, which provide information about the event.
43	Discuss the structure of the DOM, including the hierarchy of nodes like elements, text, and attributes.
44	Describe methods for capacity detection, user-agent detection, and software/hardware detection.
45	Explain how to interact with the DOM using JavaScript to manipulate, access, and modify web content.

NOTE: FRIST PREFERED YOUR SYLLBUS CONTENT, AFTER THAT PREPARED THIS QUESTION.
